PROFILE

Web Developer with 8 years of software engineering experience — the last 5 focused on TypeScript, React.js, and Next.js — building and maintaining applications for enterprise products serving tens of thousands of users. Analyzes requirements into working software, writes and runs system/unit tests, and has hands-on ownership of application security (automated SAST/DAST scanning), not just familiarity with the term. Full-stack roots include Java/Spring from early training, on top of daily Git-based collaborative workflows.

EMPLOYMENT HISTORY

Frontend Engineer | PT Inspigo Inovasi Indonesia (2021 – Present)

- Designed a config-driven UI architecture — independently-composable per-tenant components and layouts assembled at runtime, not just theming — for Inspigo For Business, now serving ~350 enterprise clients (~35,000 end users).
- Owned application security in practice: stood up weekly automated SAST/DAST scanning integrated into the CI/CD pipeline (GitHub Actions), replacing manual SSH deploys with reviewed push-to-deploy.
- Wrote and maintained unit and integration tests (Jest, React Testing Library) as part of every feature, alongside technical documentation for the systems built.
- Built a reusable form system (React Hook Form + Zod) with full input validation, and the admin dashboard's chart/reporting layer, both integrated against REST APIs and used across nearly every client organization.
- Monitored and maintained application performance post-release (Core Web Vitals, code splitting, lazy loading) to keep pace with evolving business needs.
- Used Git & GitHub daily in a collaborative team workflow; troubleshoot and resolved production issues as an ongoing responsibility.

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Analyzed operational requirements and built a Shipyard Project Management System from the ground up (Laravel + Vue.js + PostgreSQL), centralizing project/warehouse tracking and closing a prior fraud vector in the inquiry/quotation process.
- Maintained and extended a Trucking Management Application, adding GPS-based route and parking-dwell-time tracking to suit evolving operational needs.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in C#, Java, SQL Server, and JavaScript.
- Built a Library Management System using MVC concepts in both .NET and Java Spring as a final project.

EDUCATION

Physics — IPB University, 2013 – 2017

TECHNICAL SKILLS

- **Core:** TypeScript, JavaScript (ES6+), React.js, Next.js, React Hooks
- **State/Data:** Redux Toolkit / Zustand, React Hook Form + Zod, REST API integration
- **Backend (foundational):** Java, Java Spring (MVC), C#, PHP (Laravel)
- **Security:** Application security practice, automated SAST/DAST scanning (Semgrep, Nuclei, OWASP ZAP) in CI
- **Testing:** Jest, React Testing Library, unit & integration testing
- **Databases:** PostgreSQL, SQL Server
- **Tooling:** Git & GitHub, GitHub Actions (CI/CD)
- **Practices:** Requirement analysis, technical documentation, code troubleshooting and application support, cross-functional communication

Note, in the interest of an accurate match: no production experience yet with formal micro frontend architecture, Docker/Kubernetes, or React Query specifically (state management to date is Redux Toolkit/Zustand); Linux CLI and Nginx are not part of day-to-day tooling; and there's no direct banking industry background — closest analogs are the Java/Spring training above and the security-scanning and fraud-vector-closing work in enterprise production systems.
