PROFILE

Software Engineer with 8 years of experience taking features from an ambiguous requirement through production and then operating them — monitoring, debugging, and the fixes that follow. Full-stack roots (Laravel/Vue.js/PostgreSQL, closing a fraud vector in a client's quotation/inquiry workflow) underneath a frontend/AI specialization (Next.js, TypeScript, Firebase, RAG pipelines) at an enterprise product serving tens of thousands of users. Works directly with product decision makers in short cycles, and treats AI-tool output as something to verify, not trust blind.

EMPLOYMENT HISTORY

Frontend Engineer | PT Inspigo Inovasi Indonesia (2021 – Present)

- Owned features end to end on a 5-person team — from unclear product requirement through production, then monitoring and fixing what broke — for a product now serving ~350 enterprise clients (~35,000 end users).
- Built Inspigo AI's RAG pipeline (S3 ingestion → Pinecone vector store → OpenAI + Bedrock fallback), including the backend logic behind it (Next.js API routes / Node.js) and the streaming chat UX in front of it.
- Built an AI call-center QA copilot with rubric-based auto-evaluation — direct experience designing verification for AI-generated output, not just consuming it, covering all support agents (100% of sessions scored vs. ~10% manual sampling before).
- Built a reusable form system (React Hook Form + Zod) with full input validation, and the admin dashboard's reporting layer — both handling real operational and business data for client organizations.
- Used Firebase in production; owned CI/CD (GitHub Actions), weekly automated security scanning, and cloud infra migration (Vercel → AWS Amplify), with S3-based upload pipelines (presigned + Lambda-proxied).

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Built a Shipyard Project Management System from the ground up (Laravel + Vue.js + PostgreSQL) — schema through UI, alone — centralizing project/warehouse tracking and closing a prior fraud vector in the inquiry/quotation process: the kind of money-adjacent correctness problem that only shows up once you own a workflow end to end.
- Maintained and extended a Trucking Management Application, adding GPS-based route and parking-dwell-time tracking.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in C#, Java, SQL Server, and JavaScript.
- Built a Library Management System (MVC, .NET + Java Spring) as a final project.

EDUCATION

Physics — IPB University, 2013 – 2017

TECHNICAL SKILLS

- **Frontend:** React.js, Next.js, TypeScript, JavaScript (ES6+)
- **Backend:** Node.js (Next.js API routes), PHP (Laravel, CodeIgniter, CakePHP), REST API design
- **Data:** PostgreSQL, SQL Server, Firebase/Firestore
- **Cloud/Infra:** AWS (S3, Lambda, Amplify), GitHub Actions (CI/CD)
- **AI:** RAG pipeline design, LLM integration (OpenAI, Bedrock), designing evaluation/verification for AI-generated output
- **Practices:** Ownership from requirement to production and on-call operation, code review, Agile/Scrum

Note, in the interest of an accurate match: production cloud experience is AWS plus Firebase, not raw GCP; and no direct React Native or fintech/lending/healthcare-regulated background — closest analog is the fraud-vector fix at Praweda and Inspigo's enterprise data-handling work.
