PROFILE

Web Developer with 8 years of experience building responsive web applications and reporting/dashboard interfaces for business monitoring and decision-making. Translates business requirements and UI/UX designs into user-friendly interfaces, integrates them with relational databases, and has owned a dashboard/reporting layer used across nearly every client organization on an enterprise product.

EMPLOYMENT HISTORY

Frontend Engineer | PT Inspigo Inovasi Indonesia (2021 – Present)

- Built the admin dashboard's chart/reporting layer (Recharts) — designed to be readable by non-technical, business-side stakeholders — used by nearly every client organization for monitoring and reporting.
- Designed a config-driven UI architecture — per-tenant component composition and layout, not just theming — for Inspigo For Business, now serving ~350 enterprise clients (~35,000 end users), with responsive behavior across desktop, tablet, and mobile.
- Translated Figma designs and business requirements into pixel-accurate, user-friendly, accessible web interfaces (WCAG practices) using HTML/CSS/JavaScript on top of React and Next.js.
- Built a reusable form system (React Hook Form + Zod) with full input validation, powering the CMS across every Inspigo content type.
- Owned troubleshooting, debugging, and performance optimization (Core Web Vitals) as an ongoing responsibility; maintained technical documentation alongside every feature.
- Used Git/GitHub daily in a collaborative team workflow, with GitHub Actions CI/CD and weekly automated security scanning ahead of every deploy.

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Built a Shipyard Project Management System from the ground up (Laravel + Vue.js + PostgreSQL), including the database schema and data storage/retrieval layer, centralizing project/warehouse tracking and closing a prior fraud vector in the inquiry/quotation process.
- Maintained and extended a Trucking Management Application, adding GPS-based route and parking-dwell-time tracking — a monitoring/reporting feature by nature.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in C#, Java, SQL Server, and JavaScript.
- Built a Library Management System (MVC, .NET + Java Spring) as a final project.

EDUCATION

Physics — IPB University, 2013 – 2017

TECHNICAL SKILLS

- **Core:** HTML5, CSS3, JavaScript (ES6+), TypeScript, responsive web design
- **Frameworks/Libraries:** React.js, Next.js, Vue.js

- **Dashboards/Reporting:** Recharts (chart/reporting UI), business-facing data presentation, GTM/GA/MoEngage analytics dashboards
- **Databases:** PostgreSQL, SQL Server (relational schema design and integration)
- **UI/UX:** Figma-to-production translation, accessibility (WCAG), cross-device responsive design
- **Tooling:** Git & GitHub, GitHub Actions (CI/CD)
- **Practices:** Debugging/performance troubleshooting, technical documentation, cross-functional collaboration with business stakeholders

Note, in the interest of an accurate match: relational database experience is PostgreSQL and SQL Server rather than MySQL specifically (directly transferable — same SQL fundamentals), and there's no hands-on Tableau or Power BI experience — dashboard work to date has been built as custom React/Recharts UI rather than through a BI tool.
