PROFILE

Frontend Engineer with 8 years of software engineering experience — the last 5 focused on React and Next.js — building scalable applications for enterprise products serving tens of thousands of users. Designs modular, independently-composable UI architecture, writes clean and testable code through full SDLC involvement, and has hands-on ownership of secure-coding practice — running automated SAST/DAST security scanning ahead of every deploy, not just following a checklist.

EMPLOYMENT HISTORY

Frontend Engineer | PT Inspigo Inovasi Indonesia (2021 – Present)

- Designed a config-driven UI architecture — independently composable per-tenant components and layouts assembled at runtime, not just theming — for Inspigo For Business, now serving ~350 enterprise clients (~35,000 end users) across web and in-app webview channels.
- Owned secure coding in practice: stood up weekly automated security scanning (SAST/DAST with AI-formatted reports) integrated into the CI/CD pipeline, replacing manual SSH deploys with reviewed push-to-deploy.
- Built a reusable form system (React Hook Form + Zod) with full input validation, and the admin dashboard's chart/reporting layer, both used across nearly every client organization.
- Participated in the full SDLC — requirement analysis, code review, testing (Jest, React Testing Library), deployment, and post-production support — on a 5-person cross-functional team with product and design.
- Optimized application performance for speed and responsiveness across devices and browsers: green Core Web Vitals, code splitting, lazy loading.
- Built Inspigo AI's RAG pipeline (S3 → Pinecone → OpenAI + Bedrock fallback) and owned the streaming chat UX at thousands of conversations/day.

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Built a Shipyard Project Management System from the ground up (Laravel + Vue.js + PostgreSQL), centralizing project/warehouse tracking and closing a prior fraud vector in the inquiry/quotation process.
- Maintained and extended a Trucking Management Application, adding GPS-based route and parking-dwell-time tracking.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in C#, Java, SQL Server, and JavaScript.
- Built a Library Management System (MVC, .NET + Java Spring) as a final project.

EDUCATION

Physics — IPB University, 2013 – 2017

TECHNICAL SKILLS

- **Core:** JavaScript (ES6+), TypeScript, HTML5, CSS3, responsive design, cross-browser compatibility
- **React:** React.js, Next.js, React Hooks, Redux Toolkit / Zustand, Context API
- **Build/Tooling:** Next.js build pipeline, Git & GitHub, GitHub Actions (CI/CD)
- **Security:** Secure coding practices, automated SAST/DAST scanning (Semgrep, Nuclei, OWASP ZAP) in CI
- **Testing:** Jest, React Testing Library
- **Performance:** Code splitting, lazy loading, Core Web Vitals, SSR/SSG
- **Practices:** Full SDLC, code review, Agile/Scrum, technical documentation, cross-functional collaboration

Note, in the interest of an accurate match: no production experience yet with a formal Micro Frontend (MFE) framework or native hybrid/webview mobile builds — closest is the runtime-composable config-driven component architecture above and web content embedded in app webviews. Degree is Physics (a quantitative technical field) rather than CS/IT.
