Profile

Software Engineer with 8 years of experience and a Physics degree — 3 years full-stack designing relational schemas, migrating legacy and manually-recorded data into PostgreSQL, and building device-to-server data flows, then 5 years owning a multi-tenant B2B platform used by ~350 client organizations, including its event-tracking and analytics stack. Strong in SQL, TypeScript/JavaScript, PHP, HTML/CSS, AWS, and CI/CD. Looking to move from data-heavy application engineering into dedicated data engineering.

Employment History

Software Engineer | PT Inspigo Inovasi Indonesia (2021 – Present)

- Owned Inspigo For Business (IFB), a B2B enterprise learning platform, in a two-person team with one backend engineer — defining the API and data contracts between us and taking features from ambiguous requirement to production.
- Designed a config-driven, multi-tenant architecture where per-tenant configuration data drives composition and layout, so new clients onboard through configuration instead of a development cycle; scaled to ~350 client organizations (~35,000 end users).
- Owned the analytics and tracking stack end to end — event design and user-journey data via Google Tag Manager, Google Analytics, MoEngage, and the in-house inspigo-telemetry system — feeding retention and engagement analysis for product and business teams.
- Built an AI call-center QA copilot fully end to end — live-call probing, real-time call analysis, and rubric-based QA evaluation — automating 100% of session scoring versus ~10% manual sampling previously.
- Built S3 media ingestion pipelines (presigned URLs + AWS Lambda proxy) and migrated all projects from Vercel to AWS Amplify.
- Stood up CI/CD on GitHub Actions with weekly automated SAST/DAST security scanning (OWASP-standard reports), replacing manual SSH deploys with reviewed push-to-deploy; own production troubleshooting end to end.

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Built a Shipyard Project Management System from the ground up (Laravel + PostgreSQL + Vue.js) — requirement analysis, relational data modeling, REST APIs, and UI — making it the single source of truth for project, warehouse inventory, and quotation records.
- Migrated scattered, manually-recorded operational data into the new PostgreSQL system without losing history, reconciling it into one consistent schema.
- Closed a prior fraud vector by moving the inquiry/quotation process in-system with enforced, auditable records — data integrity in a money-handling flow.
- Maintained a legacy PHP Trucking Management Application with a GPS device → server → UI data flow; tuned location ingestion to a fixed 5–15 minute interval to balance data volume and API cost against tracking granularity.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in Java, C#, SQL Server, and JavaScript; built a Library Management System (MVC, Java Spring + .NET) as a final project.

Education

Physics — IPB University, 2013 – 2017

Technical Skills

- **Languages:** SQL, TypeScript / JavaScript, PHP (Laravel, legacy apps), HTML, CSS; Java (foundational)
- **Databases:** PostgreSQL, SQL Server — relational data modeling, query writing, data integrity via constraints and validation, legacy data migration
- **Cloud & DevOps:** AWS (S3, Lambda, Amplify), GitHub Actions (CI/CD), Git, SAST/DAST (Semgrep, Nuclei, OWASP ZAP)
- **Data & Analytics:** Event tracking design, GTM, Google Analytics, MoEngage, Firebase
- **Ways of working:** Agile/Scrum, code review, technical documentation, production troubleshooting
