Saepul Malik — CV (Software Engineer, Backend)

linkedin.com/in/saepulmalik27 · github.com/saepulmalik27 · saepulalmalik@gmail.com · +62 895-2733-4546 · www.saepulmalik.my.id

Profile

Software Engineer with 8 years of experience: 3 years full-stack building enterprise operational systems end to end (Laravel, PostgreSQL, REST APIs) — including closing a fraud vector in a quotation/pricing workflow — then 5 years owning a multi-tenant B2B product used by ~350 client organizations. Formally trained in Java (Spring) and SQL Server. Comfortable owning a service from data model through production, and operating it afterwards: monitoring, debugging, and the fixes that follow. Looking to go deeper on backend systems in a money-adjacent domain like insurance.

Employment History

Software Engineer (Frontend Lead) | PT Inspigo Inovasi Indonesia (2021 – Present)

- Owned Inspigo For Business (IFB), a B2B enterprise learning platform, in a two-person team with one backend engineer — working closely on the APIs between us and taking features from ambiguous requirement to production.
- Replaced hardcoded per-client builds with a config-driven, multi-tenant architecture where tenant configuration drives composition and layout, so new clients onboard through configuration instead of a development cycle; scaled to ~350 client organizations (~35,000 end users).
- Built an AI call-center QA copilot fully end to end — live-call probing, real-time call analysis, and rubric-based QA evaluation — automating 100% of session scoring versus ~10% manual sampling previously.
- Built S3 media upload pipelines (presigned URLs + AWS Lambda proxy) and migrated all projects from Vercel to AWS Amplify.
- Stood up CI/CD on GitHub Actions with weekly automated SAST/DAST security scanning, replacing manual SSH deploys with reviewed push-to-deploy; lead code review and own production troubleshooting end to end.
- Built the frontend for Inspigo AI (streaming chat UI over WebSocket, later SSE, and the knowledge-base document CMS), integrated with the backend's OpenAI/Bedrock + Pinecone RAG pipeline.

Full Stack Developer | PT Praweda Sarana Informatika (Outsourced by PT Indocyber) (2018 – 2021)

- Built a Shipyard Project Management System from the ground up (Laravel + PostgreSQL + Vue.js) — requirement analysis, relational schema design, REST APIs, and UI — centralizing project and warehouse tracking.
- Closed a prior fraud vector in the inquiry/quotation process by bringing it into the system — a correctness problem in a money-handling flow that only shows up once you own the workflow end to end.
- Maintained and extended a Trucking Management Application, adding GPS-based route and parking-dwell-time tracking for fleet operations.

Full Stack Developer Trainee | PT Indocyber Global Technology (2018)

- Trained in Java, C#, SQL Server, and JavaScript; built a Library Management System (MVC, Java Spring + .NET) as a final project.

Education

Physics — IPB University, 2013 – 2017

Technical Skills

- **Languages:** Java (Spring, foundational), PHP (Laravel), TypeScript / JavaScript, SQL
- **Data:** PostgreSQL, SQL Server — relational schema design, query writing, data integrity via constraints and validation
- **Backend & Cloud:** REST API design, AWS (S3, Lambda, Amplify), GitHub Actions (CI/CD), SAST/DAST (Semgrep, Nuclei, OWASP ZAP)
- **Fundamentals:** Data structures and algorithms, Git, code review, production troubleshooting, Agile/Scrum
- **Also:** React, Next.js, Vue.js, streaming LLM integrations (SSE, WebSocket)
